Selected Projects

- **Incorporating Domain Knowledge in Neurons**: We propose a simple, efficient, interpretable zero-shot learning approach. By explicitly grounding intermediate concepts captured by neurons in human-interpretable domains, our approach – Neuron-Importance Aware Weight Transfer (NIWT) – not only allows learning deep classifiers for novel classes but also helps in explaining the decisions made by such classifiers at a fine-grained level of neurons.
- **Evaluating Visual Conversational Agents**: We designed a cooperative 'image-guessing' game - GuessWhich - to evaluate the utility of state-of-the-art visual dialog agents by pairing them with humans. While AI literature suggests agents (chatbots) trained in such a collaborative self-play setting via RL perform better than their SL counterparts – our human studies suggest this improvement in performance does not translate to human-AI teams.
