SELECTED PROJECTS**Incorporating Domain Knowledge in Neurons**

We propose a simple, efficient, interpretable zero-shot learning approach. By explicitly grounding intermediate concepts captured by neurons in human-interpretable domains, our approach – Neuron-Importance Aware Weight Transfer (NIWT) – not only allows learning deep classifiers for novel classes but also helps in explaining the decisions made by such classifiers at a fine-grained level of neurons.

Evaluating Visual Conversational Agents

We designed a cooperative ‘image-guessing’ game - GuessWhich - to evaluate the utility of state-of-the-art visual dialog agents by pairing them with humans. While AI literature suggests agents (chatbots) trained in such a collaborative self-play setting via RL perform better than their SL counterparts – our human studies suggest this improvement in performance does not translate to human-AI teams.

Exploring Weak Supervision and Generative Models for Semantic Segmentation
Course Project, Probabilistic Graphical Models

We explored weakly supervised semantic segmentation using localization cues obtained from GradCAM – a post-hoc saliency map generation approach for deep networks. We further studied semantic segmentation via deep probabilistic generative models. Specifically, we used joint VAE models with retrofitted unimodal inference networks to model the joint distribution of image, attributes and segmentation maps.
